*Asset Lifecycle Management*

*Iron Mountain*

Drive sustainability and boost CSR metrics with responsible IT asset disposal in your data centre

# Putting the e-waste problem into perspective

**E-waste** is the **fastest growing type of waste globally**, and the growth of e-waste generation is **outpacing the formal collection and recycling** by almost a **factor of 5**.<sup>1</sup>

Currently e-waste recycling rates are ~22%. They are expected to **DROP** to 20% by 2030.<sup>1</sup>

Recycling metals from e-waste, instead of extracting new raw materials, avoided approximately **52 million metric tons of planet-warming emissions** in 2022.<sup>1</sup> Think of the avoided emissions if more than 22% of e-waste were recycled.

# Data centre equipment supply chain

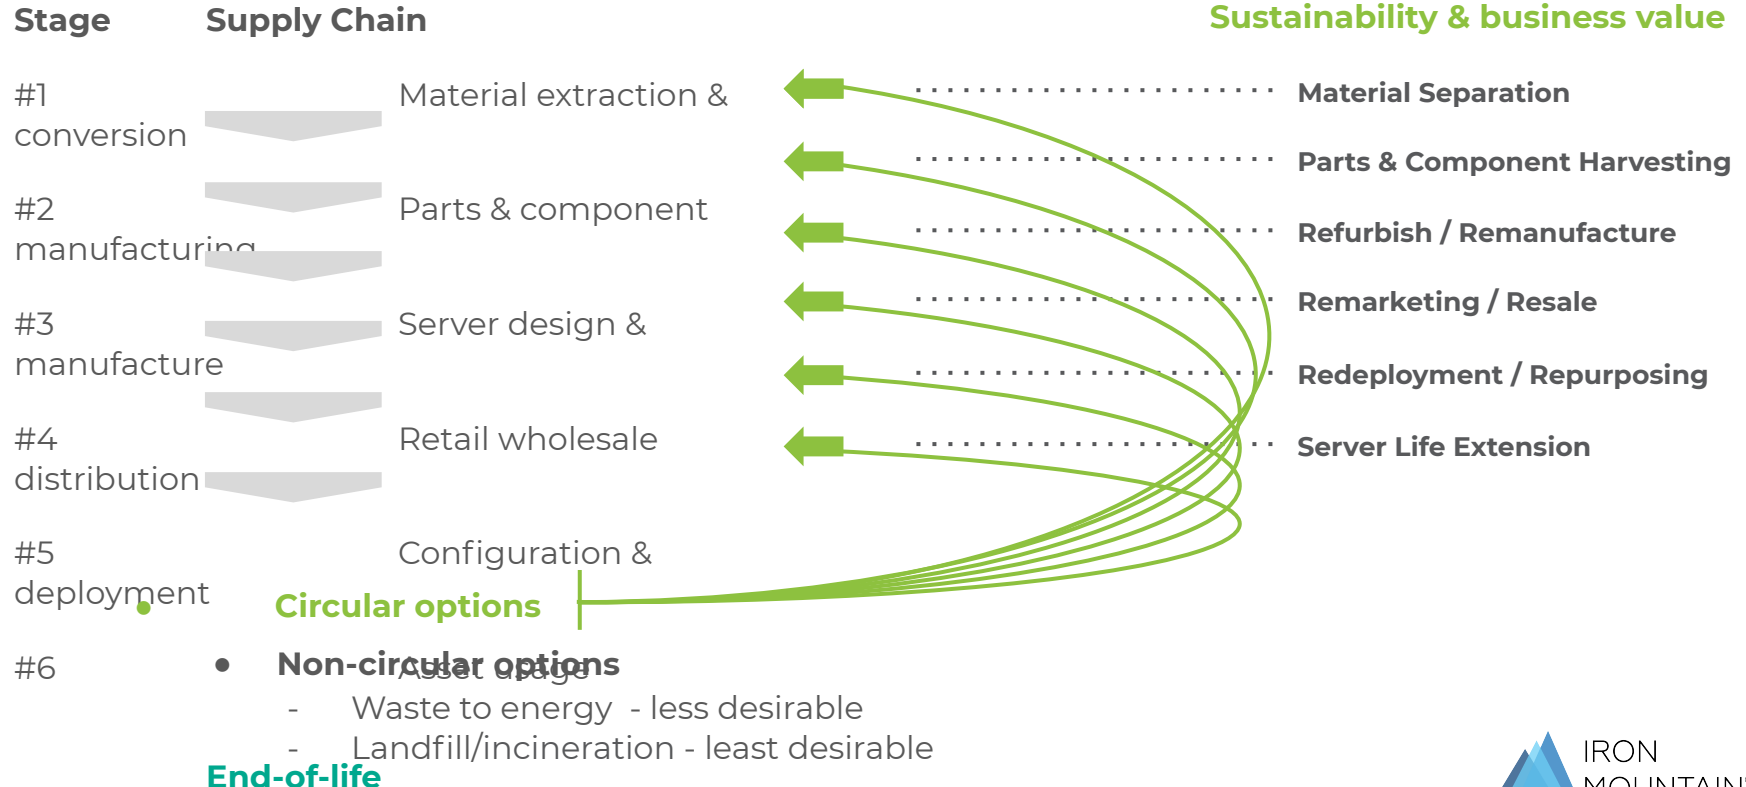

A linear path from raw material extraction to equipment usage

## Stage Supply Chain

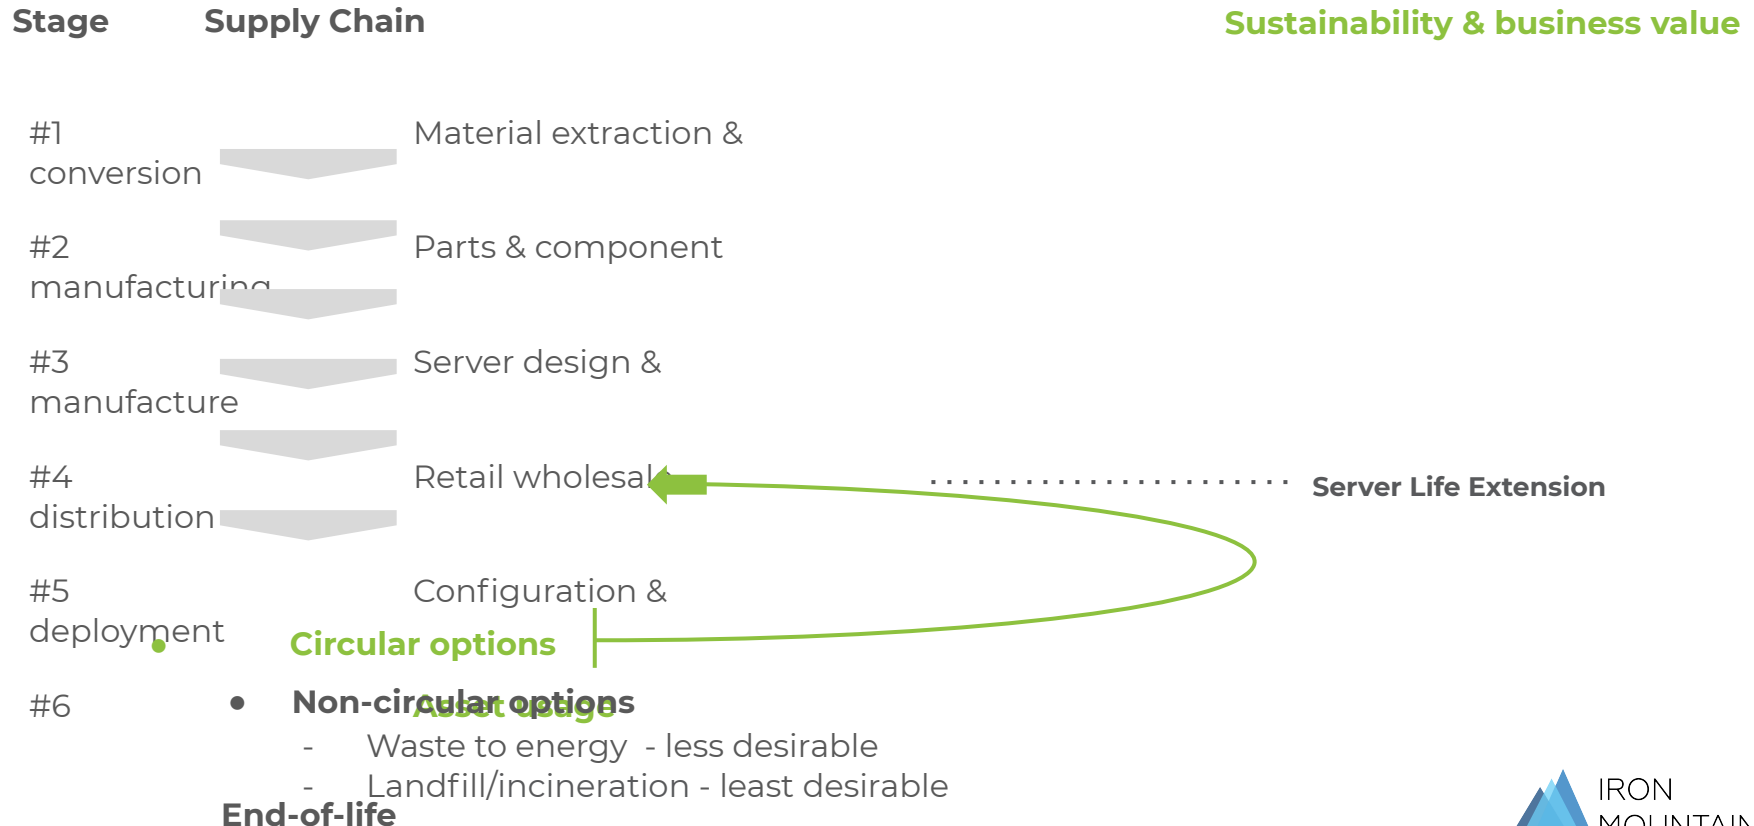

#1		Material extraction & conversion
		
#2		Parts & component manufacturing
		
#3		Server design & manufacture
		
#4		Retail wholesale distribution
		
#5		Configuration & deployment
		
#6		Asset usage

# A circular economy approach

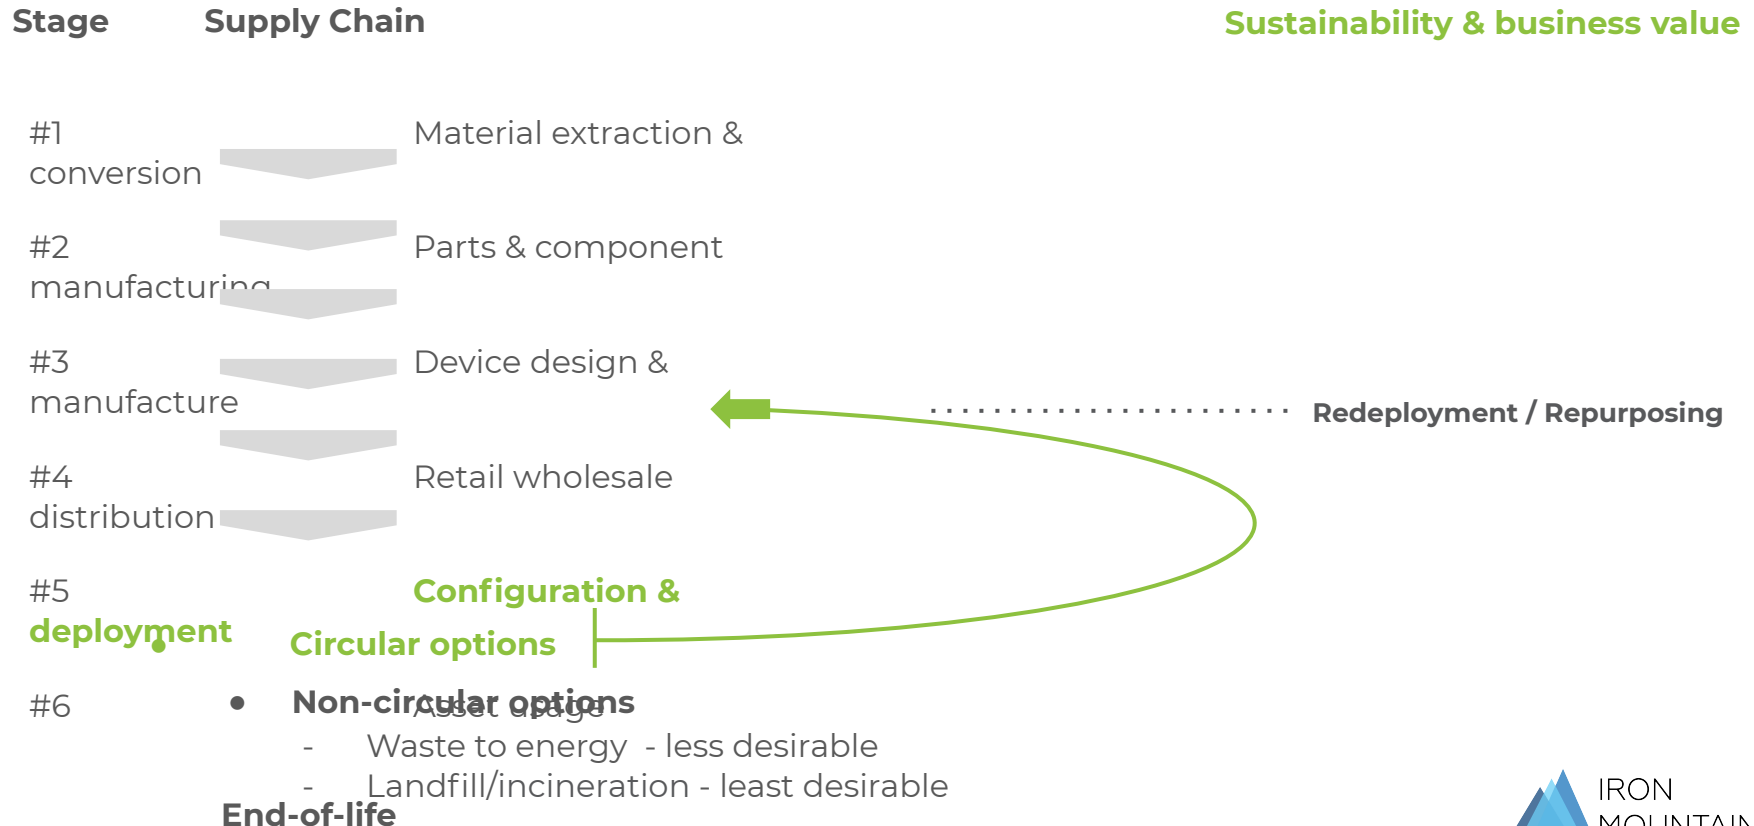

Deliver secure, sustainable & economic benefits
